

Datavision is a multi-Platform solution with a plug and play hardware box and a web platform that allows business owners to have real time tracking data of their visitor's behavior such as visit count, visit duration, conversion rate, visits timeline, age group and gender recognition. Datavision helps business owners in the retail industry improving their customers and visitors' experiences using the visual live data collected using the cameras and sensors in the hardware unit also screening advertising displays showing the accurate content in real time for spectators.

We are aiming to expand our team by recruiting an artificial intelligence engineer that will have for missions :

- Drive the analysis, design and implementation of algorithms for Datavision products.
- Profile and optimize the performance of existing AI applications.
- Develop real-time computer vision applications on dedicated CUDA enabled hardware.
